# BISMICA COLORS

*Cosmetic Pearlescent Pigments*

by FQ Specialty Chemicals.

BISMICA AND BISMICA MAX COLORS are a uniquely bonded combination of pigments, bismuth oxychloride and muscovite mica. These pearlescent pigments provide clear intense color and subdued satiny luster in each crystalline particle. Readily blended, dispersed, or compressed in cosmetic formulations, their main applications include:

Pressed Powders, Cream Eye Shadows, Mineral Makeup, and every colored cosmetic formulation including lipsticks and eyeliners.

BISMICA AND BISMICA MAX COLORS help reduce process-intensive milling by being easily blended into the final formulation. Superior skin adhesion, pearlescent brilliance, and a unique optical appearance are all simultaneously attained.
